Please tell us a little bit about yourself.

What is your current education status?

- Undergraduate student
- Masters student
- PhD student
- Not currently in a degree program

How many years of experience training neural networks have you had?

- This class is my first experience
- Less than 6 months
- 6 months - 1 year
- 1 - 2 years
- 2+ years

How experienced would you consider yourself at training neural networks?

- Very inexperienced
- Some experience
- Moderately experienced
- Expert

What types of networks have you trained before? (Select all that apply.)

- Fully connected networks
- Convolutional neural networks
- Recurrent neural networks
- Networks for vision tasks
- Networks for NLP tasks
- None of the above

Instructions:

- You will be provided a random dataset. Your goal is to train a neural network for classification on the dataset, and obtain the **highest validation accuracy** that you can.
- In the first stage, you will choose the initial network configuration.
- In the second stage, you will monitor the training process and have the option of adjusting hyperparameters at every epoch.

You have trained 0 networks so far!

Last Time: Recurrent Networks

How can you add layers during training?

- paper
① Net2Net by Ian Goodfellow's author
② Network Morphism from Microsoft

Last Time: Recurrent Networks

For $\bigoplus_{n=1,\dots,m} \mathcal{L}_{m,n} = 0$, hence we can find a closed subset \mathcal{H} in \mathcal{H} and any sets \mathcal{F} on X , U is a closed immersion of S , then $U \rightarrow T$ is a separated algebraic space.

Proof. Proof of (1). It also start we get

$$S = \text{Spec}(R) = U \times_X U \times_X U$$

and the comparicoly in the fibre product covering we have to prove the lemma generated by $\coprod Z \times_U U \rightarrow V$. Consider the maps M along the set of points \mathcal{Sch}_{fppf} and $U \rightarrow U$ is the fibre category of S in U in Section ?? and the fact that any U affine, see Morphisms, Lemma ?? . Hence we obtain a scheme S and any open subset $W \subset U$ in $\mathcal{Sh}(G)$ such that $\text{Spec}(R') \rightarrow S$ is smooth or an

$$U = \bigcup U_i \times_{S_i} U_i$$

which has a nonzero morphism we may assume that f_i is of finite presentation over S . We claim that $\mathcal{O}_{X,x}$ is a scheme where $x, x', s'' \in S'$ such that $\mathcal{O}_{X,x'} \rightarrow \mathcal{O}_{X',x'}$ is separated. By Algebra, Lemma ?? we can define a map of complexes $\text{GL}_{S'}(x'/S'')$ and we win. \square

To prove study we see that $\mathcal{F}|_U$ is a covering of \mathcal{X}' , and \mathcal{T}_i is an object of $\mathcal{F}_{X/S}$ for $i > 0$ and \mathcal{F}_p exists and let \mathcal{F}_i be a presheaf of \mathcal{O}_X -modules on \mathcal{C} as a \mathcal{F} -module. In particular $\mathcal{F} = U/\mathcal{F}$ we have to show that

$$\widetilde{M}^\bullet = \mathcal{I}^\bullet \otimes_{\text{Spec}(k)} \mathcal{O}_{S,s} - i_X^{-1} \mathcal{F}$$

is a unique morphism of algebraic stacks. Note that

$$\text{Arrows} = (\mathcal{Sch}/S)_{fppf}^{\text{opp}}, (\mathcal{Sch}/S)_{fppf}$$

and

$$V = \Gamma(S, \mathcal{O}) \longrightarrow (U, \text{Spec}(A))$$

is an open subset of X . Thus U is affine. This is a continuous map of X is the inverse, the groupoid scheme S .

Proof. See discussion of sheaves of sets. \square

The result for prove any open covering follows from the less of Example ?? . It may replace S by $X_{\text{spaces},\text{\'etale}}$ which gives an open subspace of X and T equal to S_{Zar} , see Descent, Lemma ?? . Namely, by Lemma ?? we see that R is geometrically regular over S .

PANDARUS:

Alas, I think he shall be come approached and the day
When little strain would be attain'd into being never fed,
And who is but a chain and subjects of his death,
I should not sleep.

Second Senator:

They are away this miseries, produced upon my soul,
Breaking and strongly should be buried, when I perish
The earth and thoughts of many states.

DUKE VINCENTIO:

Well, your wit is in the care of side and that.

Second Lord:

They would be ruled after this chamber, and
my fair nues begun out of the fact, to be conveyed,
Whose noble souls I'll have the heart of the wars.

Clown:

Come, sir, I will make did behold your worship.

VIOLA:

I'll drink it.

```
static void do_command(struct seq_file *m, void *v)
{

Learnable Upsampling: Transpose Convolution

Recall: Normal 3×3 convolution, stride 2 pad 1

Learnable Upsampling: Transpose Convolution

Recall: Normal 3×3 convolution, stride 2 pad 1

Input: 4×4

Dot product
between filter
and input

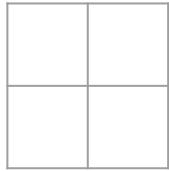

Output: 2×2

Filter moves 2 pixels in
the input for every one
pixel in the output

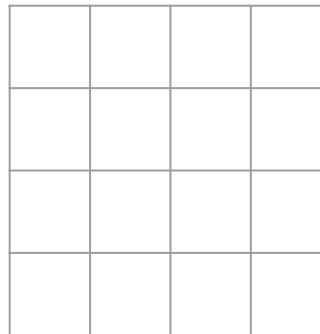

Stride gives ratio between
movement in input and
output

Learnable Upsampling: Transpose Convolution

3×3 **transpose** convolution, stride 2 pad 1

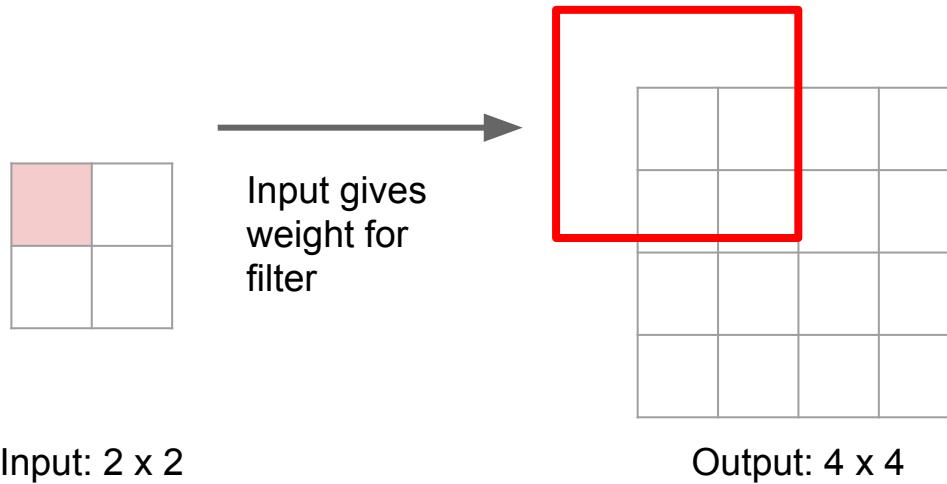

Input: 2×2

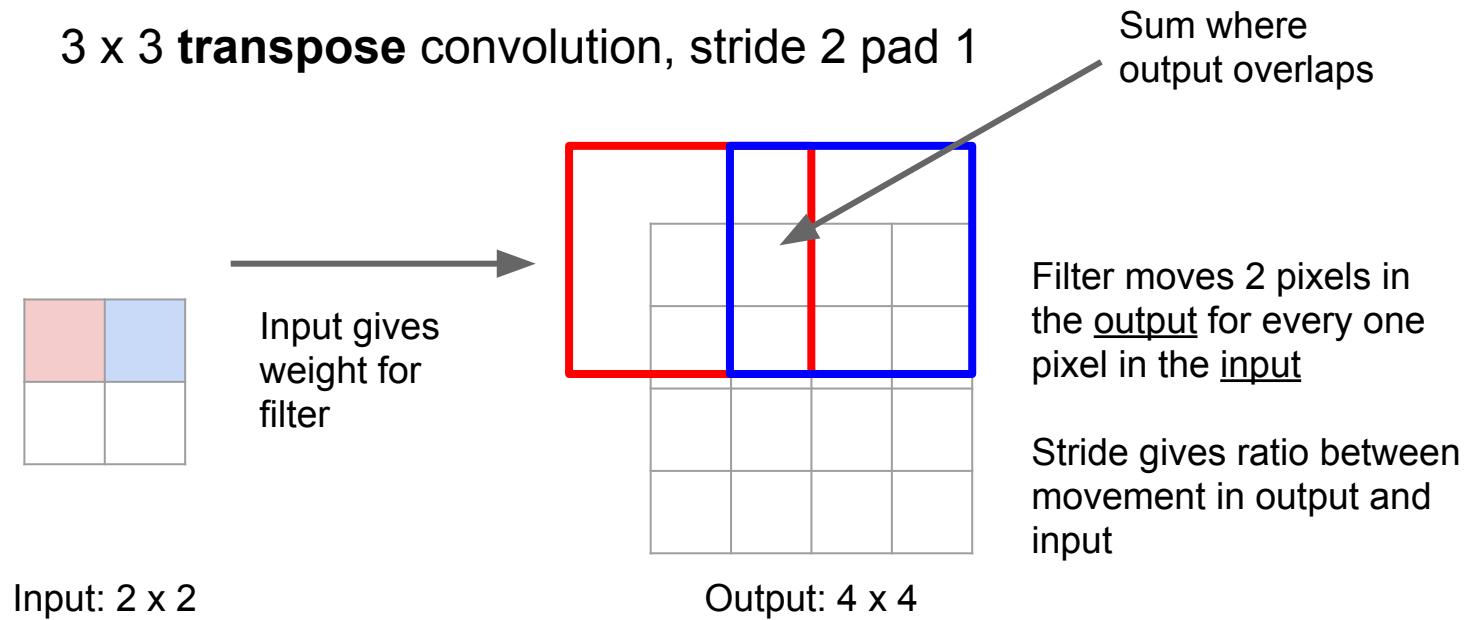

Output: 4×4

Learnable Upsampling: Transpose Convolution

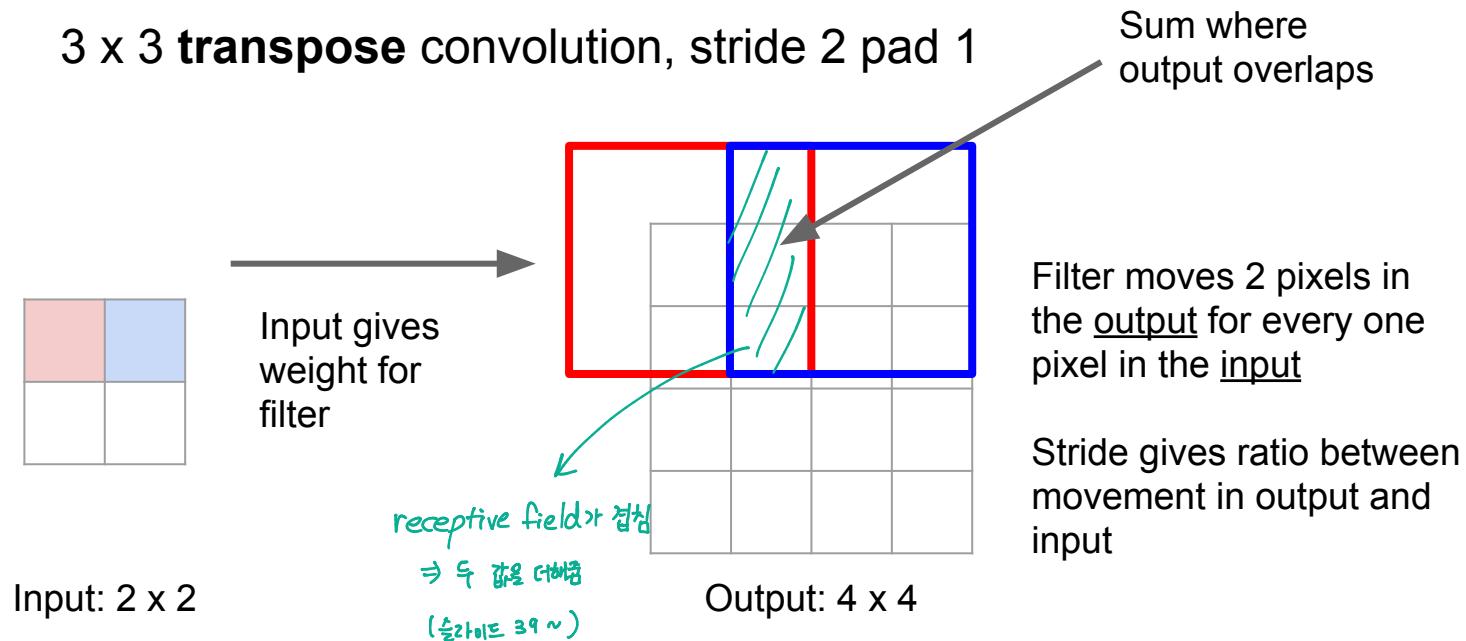

3 x 3 **transpose** convolution, stride 2 pad 1

Learnable Upsampling: Transpose Convolution

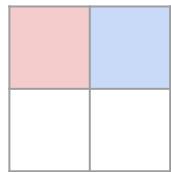

Learnable Upsampling: Transpose Convolution

Learnable Upsampling: Transpose Convolution

Other names:

- Deconvolution (bad)
- Upconvolution
- Fractionally strided convolution
- Backward strided convolution

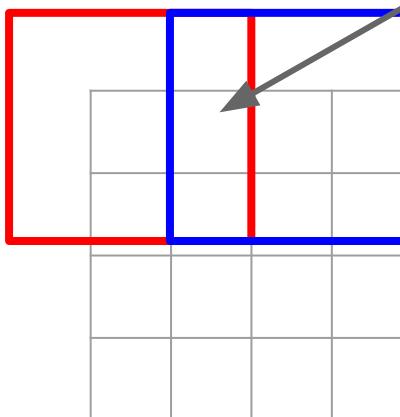

Input: 2 x 2

3 x 3 transpose convolution, stride 2 pad 1

Input gives weight for filter

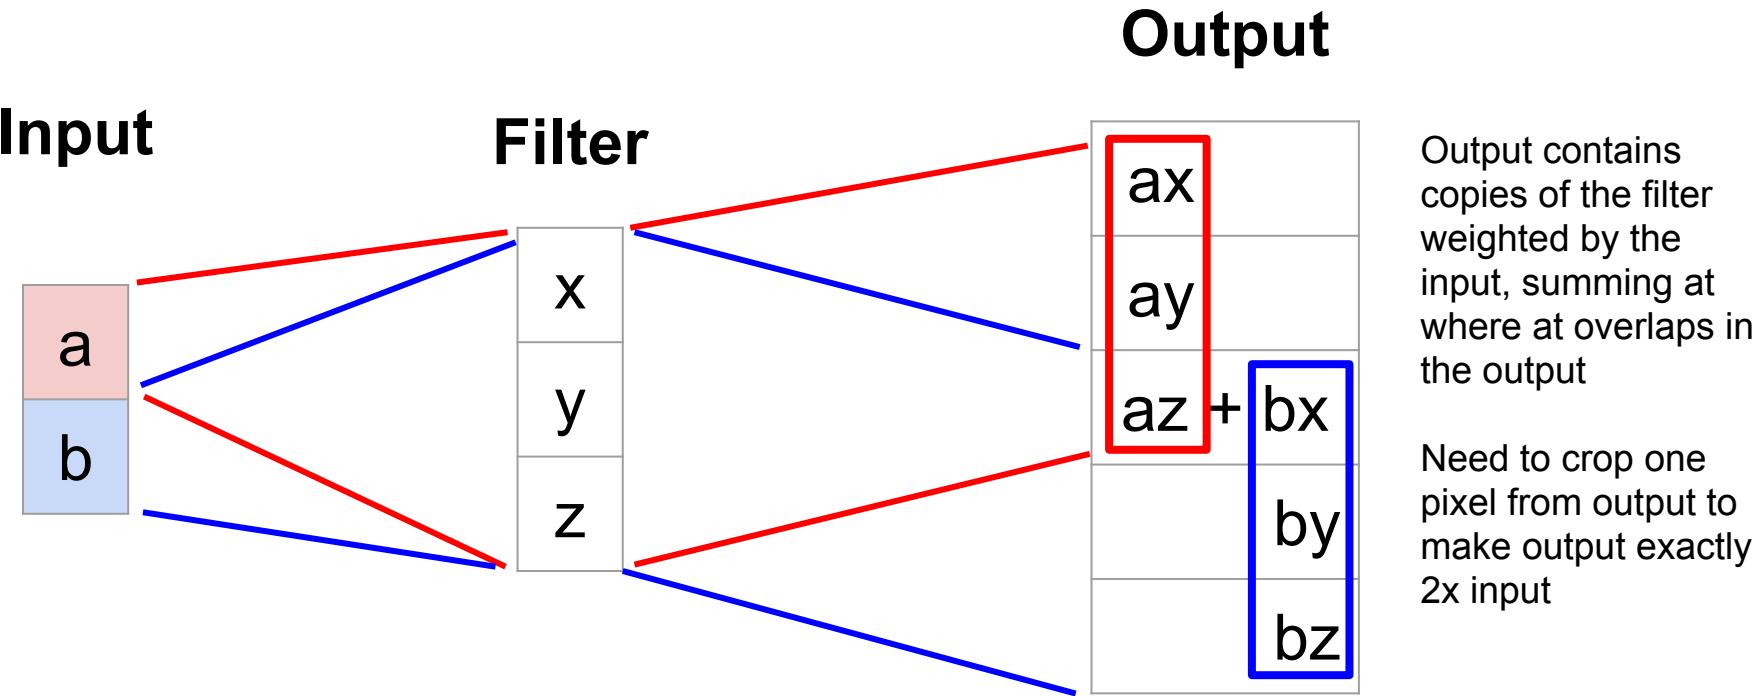

Output: 4 x 4

Filter moves 2 pixels in the output for every one pixel in the input

Stride gives ratio between movement in output and input

Transpose Convolution: 1D Example

Convolution as Matrix Multiplication (1D Example)

We can express convolution in terms of a matrix multiplication

$$\vec{x} * \vec{a} = X\vec{a}$$

$$\begin{bmatrix} x & y & x & 0 & 0 & 0 \\ 0 & x & y & x & 0 & 0 \\ 0 & 0 & x & y & x & 0 \\ 0 & 0 & 0 & x & y & x \end{bmatrix} \begin{bmatrix} 0 \\ a \\ b \\ c \\ d \\ 0 \end{bmatrix} = \begin{bmatrix} ay + bz \\ ax + by + cz \\ bx + cy + dz \\ cx + dy \end{bmatrix}$$

Example: 1D conv, kernel size=3, stride=1, padding=1

Convolution as Matrix Multiplication (1D Example)

We can express convolution in terms of a matrix multiplication

$$\vec{x} * \vec{a} = X\vec{a}$$

$$\begin{bmatrix} x & y & x & 0 & 0 & 0 \\ 0 & x & y & x & 0 & 0 \\ 0 & 0 & x & y & x & 0 \\ 0 & 0 & 0 & x & y & x \end{bmatrix} \begin{bmatrix} 0 \\ a \\ b \\ c \\ d \\ 0 \end{bmatrix} = \begin{bmatrix} ay + bz \\ ax + by + cz \\ bx + cy + dz \\ cx + dy \end{bmatrix}$$

Example: 1D conv, kernel size=3, stride=1, padding=1

Convolution transpose multiplies by the transpose of the same matrix:

$$\vec{x} *^T \vec{a} = X^T \vec{a}$$

$$\begin{bmatrix} x & 0 & 0 & 0 \\ y & x & 0 & 0 \\ z & y & x & 0 \\ 0 & z & y & x \\ 0 & 0 & z & y \\ 0 & 0 & 0 & z \end{bmatrix} \begin{bmatrix} a \\ b \\ c \\ d \end{bmatrix} = \begin{bmatrix} ax \\ ay + bx \\ az + by + cx \\ bz + cy + dx \\ cz + dy \\ dz \end{bmatrix}$$

When stride=1, convolution transpose is just a regular convolution (with different padding rules)

Convolution as Matrix Multiplication (1D Example)

We can express convolution in terms of a matrix multiplication

$$\vec{x} * \vec{a} = X\vec{a}$$

$$\begin{bmatrix} x & y & x & 0 & 0 & 0 \\ 0 & 0 & x & y & x & 0 \end{bmatrix} \begin{bmatrix} 0 \\ a \\ b \\ c \\ d \\ 0 \end{bmatrix} = \begin{bmatrix} ay + bz \\ bx + cy + dz \end{bmatrix}$$

Example: 1D conv, kernel size=3, stride=2, padding=1

Convolution as Matrix Multiplication (1D Example)

We can express convolution in terms of a matrix multiplication

$$\vec{x} * \vec{a} = X\vec{a}$$

$$\begin{bmatrix} x & y & z & 0 & 0 & 0 \\ 0 & 0 & x & y & z & 0 \end{bmatrix} \begin{bmatrix} 0 \\ a \\ b \\ c \\ d \\ 0 \end{bmatrix} = \begin{bmatrix} ay + bz \\ bx + cy + dz \end{bmatrix}$$

Example: 1D conv, kernel size=3, stride=2, padding=1

Convolution transpose multiplies by the transpose of the same matrix:

$$\vec{x} *^T \vec{a} = X^T \vec{a}$$

$$\begin{bmatrix} x & 0 \\ y & 0 \\ z & x \\ 0 & y \\ 0 & z \\ 0 & 0 \end{bmatrix} \begin{bmatrix} a \\ b \end{bmatrix} = \begin{bmatrix} ax \\ ay \\ az + bx \\ by \\ bz \\ 0 \end{bmatrix}$$

When stride>1, convolution transpose is no longer a normal convolution!

Semantic Segmentation Idea: Fully Convolutional

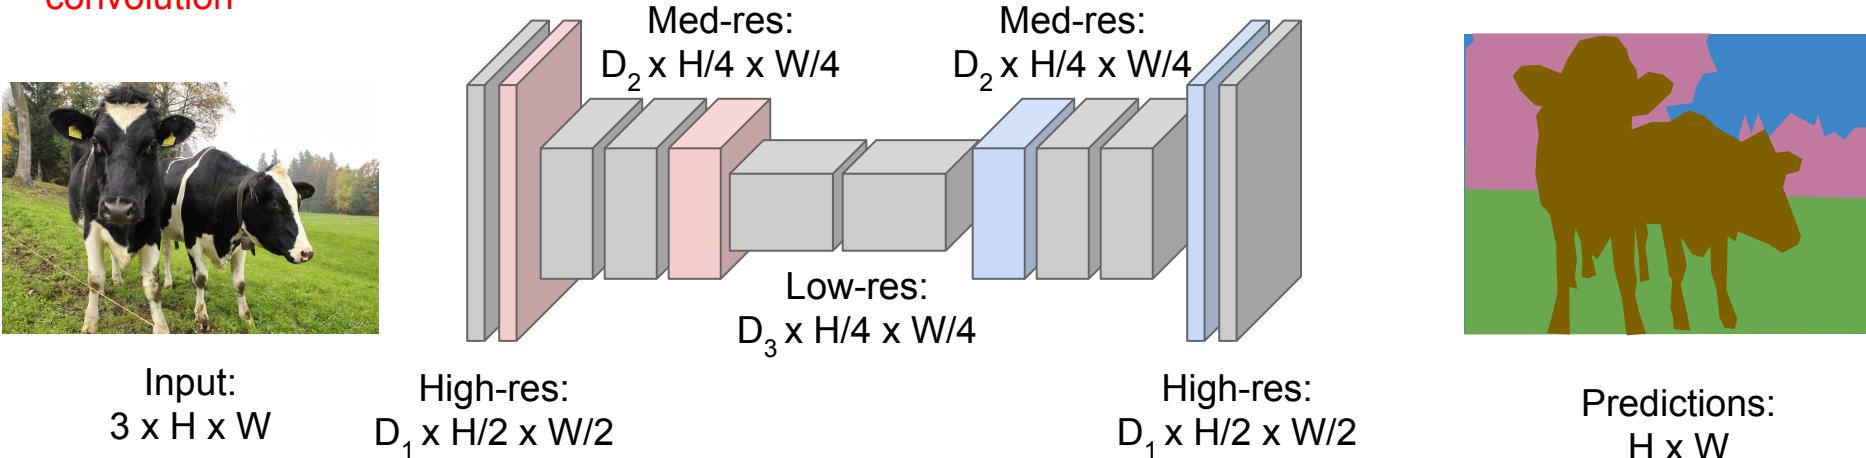

Downsampling:
Pooling, strided convolution

Input:
 $3 \times H \times W$

Region Proposals

- Find “blobby” image regions that are likely to contain objects
- Relatively fast to run; e.g. Selective Search gives 1000 region proposals in a few seconds on CPU

Faster R-CNN: RoI Pooling

Hi-res input image:
 $3 \times 640 \times 480$
with region
proposal

Hi-res conv features:
 $512 \times 20 \times 15$;
Projected region
proposal is e.g.
 $512 \times 18 \times 8$
(varies per proposal)

RoI conv features:
 $512 \times 7 \times 7$
for region proposal

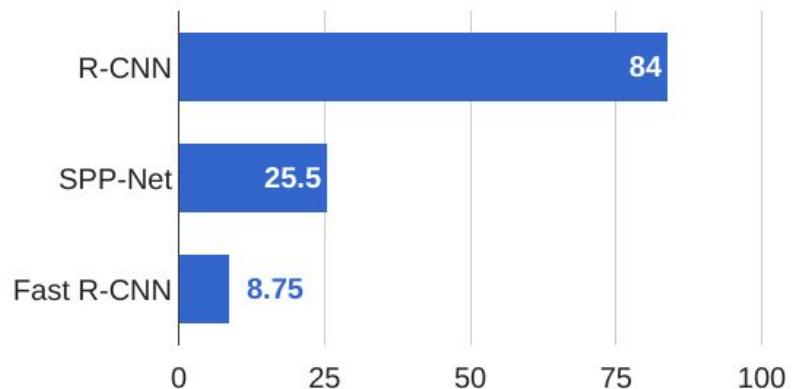

Fully-connected layers expect
low-res conv features:
 $512 \times 7 \times 7$

Girshick, "Fast R-CNN", ICCV 2015.

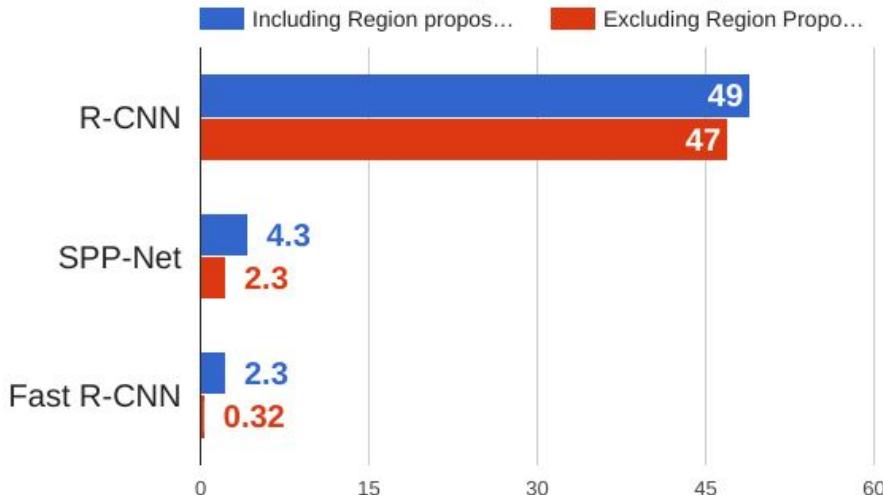

R-CNN vs SPP vs Fast R-CNN

가장 좋은

Training time (Hours)

Test time (seconds)

Girshick, "Fast R-CNN", ICCV 2015

Faster R-CNN:

Make CNN do proposals!

Insert **Region Proposal Network (RPN)** to predict proposals from features

Jointly train with 4 losses:

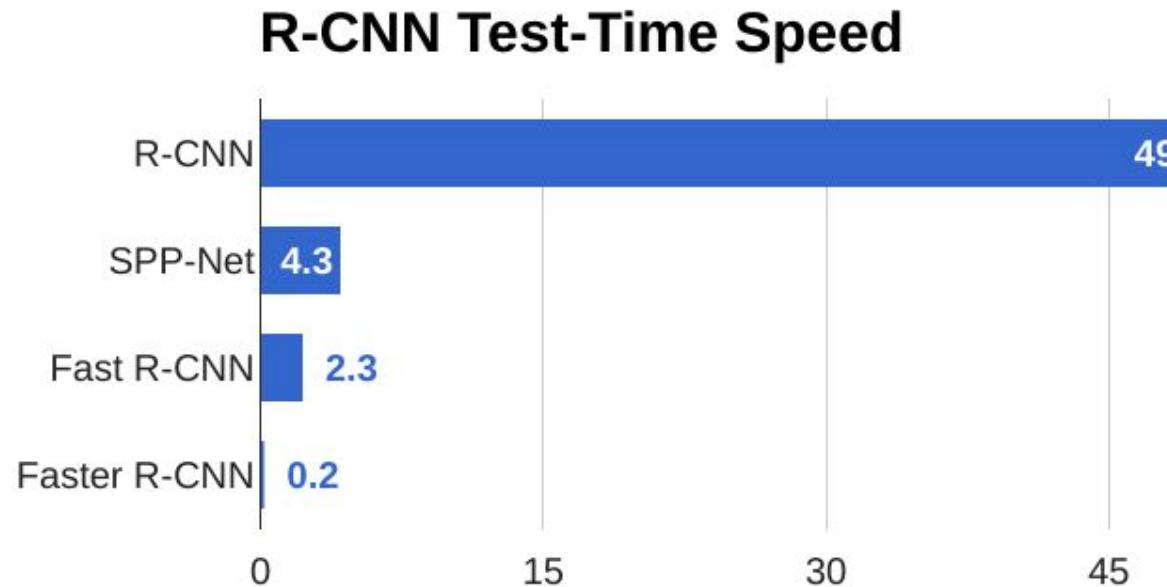

1. RPN classify object / not object
2. RPN regress box coordinates
3. Final classification score (object classes)
4. Final box coordinates

Ren et al, "Faster R-CNN: Towards Real-Time Object Detection with Region Proposal Networks", NIPS 2015

Faster R-CNN:

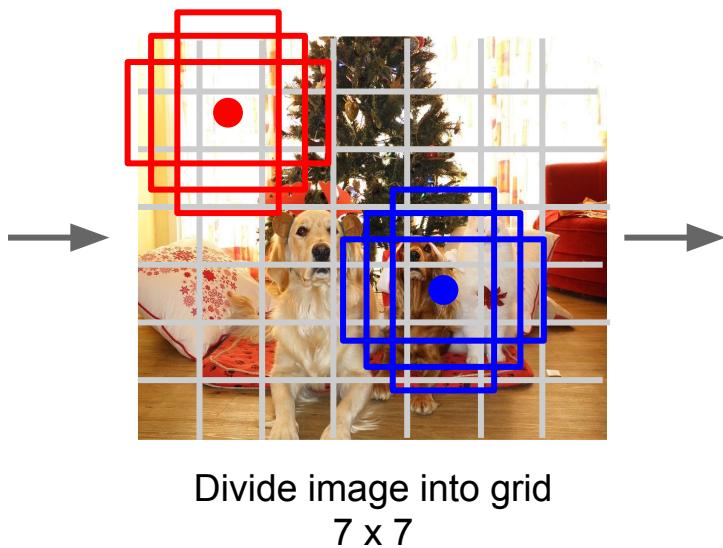

Make CNN do proposals!

Detection without Proposals: YOLO / SSD

Input image
 $3 \times H \times W$

Divide image into grid
 7×7

Image a set of **base boxes**
centered at each grid cell
Here $B = 3$

1-stage method

Within each grid cell:

- Regress from each of the B base boxes to a final box with 5 numbers:
(dx , dy , dh , dw , confidence)
- Predict scores for each of C classes (including background as a class)

Output:
 $7 \times 7 \times (5 * B + C)$

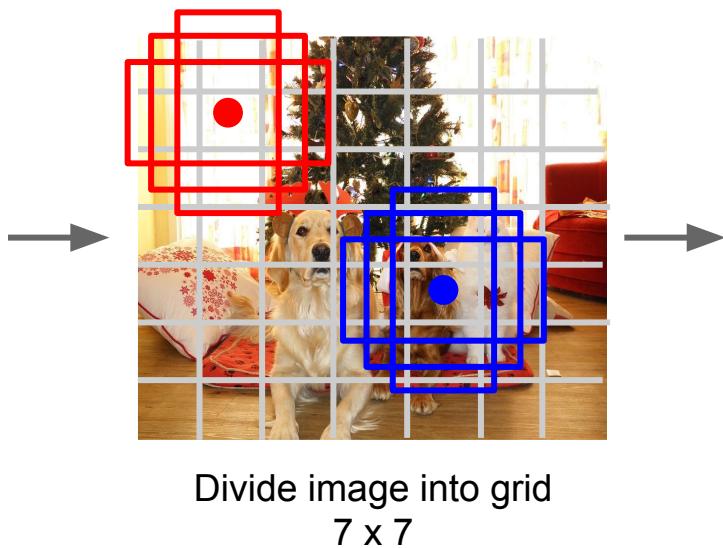

Redmon et al, "You Only Look Once:
Unified, Real-Time Object Detection", CVPR 2016
Liu et al, "SSD: Single-Shot MultiBox Detector", ECCV 2016

Detection without Proposals: YOLO / SSD

Go from input image to tensor of scores with one big convolutional network!

Input image
 $3 \times H \times W$

Divide image into grid
 7×7

Image a set of **base boxes**
centered at each grid cell
Here $B = 3$

- Within each grid cell:
- Regress from each of the B base boxes to a final box with 5 numbers:
(dx , dy , dh , dw , confidence)
 - Predict scores for each of C classes (including background as a class)

Output:
 $7 \times 7 \times (5 * B + C)$

Takeaways

Faster R-CNN is slower but more accurate

SSD is much faster but not as accurate
